

Lesson no. 16: What If Analysis-Data Table

Data Tables

Instead of creating different scenarios, you can create a data table to quickly try out different values for formulas. You can create a one variable data table or a two variable data table.

Assume you own a book store and have 100 books in storage. You sell a certain % for the highest price of \$50 and a certain % for the lower price of \$20. If you sell 60% for the highest price, cell D10 below calculates a total profit of 60 * \$50 + 40 * \$20 = \$3800.

One Variable Data Table

To create a one variable data table, execute the following steps.

- 1. Select cell B12 and type =D10 (refer to the total profit cell).
- 2. Type the different percentages in column A.
- 3. Select the range A12:B17.

We are going to calculate the total profit if you sell 60% for the highest price, 70% for the highest price, etc.

6R	x 2C	▼ : × √ fx			
	А	В	С	D	E
1	Book	Store			
2					
3		total number of books	% sold for the highest price		
4		100	60%		
5					
6			number of books	unit profit	
7		highest price	60	\$50	
8		lower price	40	\$20	
9					
10			total profit	\$3,800	
11					
12		\$3,800			
13	60%				
14	70%				
15	80%				
16	90%				
17	100%	¢			
18					

4. On the Data tab, in the Forecast group, click What-If Analysis.

⊂ S S		$\overline{\mathbf{x}}$			e(= E			, F
Text to	Flash	Remove	Data	Consolidate	Relationships	Manage	What-If	Forecast
Columns	Fill	Duplicates	Validation 🔻			Data Model	Analysis 🕶	Sheet
			Data T	ools			Fored	ast

5. Click Data Table.

<u>S</u>cenario Manager... <u>G</u>oal Seek... Data <u>T</u>able...

6. Click in the 'Column input cell' box (the percentages are in a column) and select cell C4.

We select cell C4 because the percentages refer to cell C4 (% sold for the highest price). Together with the formula in cell B12, Excel now knows that it should replace cell C4 with 60% to calculate the total profit, replace cell C4 with 70% to calculate the total profit, etc.

Data Table		?	×
<u>R</u> ow input cell:			1
<u>C</u> olumn input cell:	SCS4		5
ОК		Car	ncel

Note: this is a one variable data table so we leave the Row input cell blank.

7. Click OK.

Result.

B1	B13 \checkmark : \times \checkmark f_x {=TABLE(,C4)}					
	А	В	С	D	E	
1	Book	Store				
2						
3		total number of books	% sold for the highest price			
4		100	60%			
5						
6			number of books	unit profit		
7		highest price	60	\$50		
8		lower price	40	\$20		
9						
10			total profit	\$3,800		
11						
12		\$3,800				
13	60%	\$3,800				
14	70%	\$4,100				
15	80%	\$4,400				
16	90%	\$4,700				
17	100%	\$5,000				
18						

Conclusion: if you sell 60% for the highest price, you obtain a total profit of \$3800, if you sell 70% for the highest price, you obtain a total profit of \$4100, etc.

Note: the formula bar indicates that the cells contain an array formula. Therefore, you cannot delete a single result. To delete the results, select the range B13:B17 and press Delete.

Two Variable Data Table

To create a two variable data table, execute the following steps.

1. Select cell A12 and type =D10 (refer to the total profit cell).

- 2. Type the different unit profits (highest price) in row 12.
- 3. Type the different percentages in column A.
- 4. Select the range A12:D17.

We are going to calculate the total profit for the different combinations of 'unit profit (highest price)' and '% sold for the highest price'.

$6R \times 4C$ \checkmark : \times \checkmark f_x =D10
