

### Lesson no. 7: How to Install WordPress

#### How to install WordPress via cPanel and autoinstallers

cPanel is the dashboard that most web hosts give their customers. When you sign up for hosting, your host should provide you with login details for cPanel. And for most hosts, the cPanel interface looks something like this:

In your cPanel interface, your host should give you something called an autoinstaller. Autoinstallers basically automate the full WordPress install process that I'll outline in the next section. So instead of needing to do everything manually, you just input some basic information, click a button, and the autoinstaller installs WordPress for you.

There are a few different autoinstallers you might encounter:

#### Softaculous

And while there might be a few minor interface differences, all of the autoinstallers more or less function the same. So while I'll show you an example using Softaculous, the exact interface for your autoinstaller might look a tiny bit different.

To get started, find the link to the WordPress autoinstaller in cPanel and give it a click:

# **Digital Marketing**

On the next screen, you should see an **Install Now** link (no matter which auto installer you're using). Just give that another click:

Next, you'll need to enter details for your WordPress install. Again, this interface should generally look the same no matter which autoinstaller you're using.

First, fill in the protocol and domain name where you want to install WordPress:

Choose Protocol If your site has SSL, then please choose the HTTPS protocol. Choose Domain Cnewcomer.com	
choose the HTTPS protocol. Choose Domain Cnewcomer.com	Ŧ
Please choose the domain to install	¥

For **Protocol**, if you're using an SSL certificate, you should choose HTTPS. Otherwise, you should choose HTTP. Unless you purposefully installed an SSL Certificate, **the default is HTTP.** 

Next, choose the directory in which you want to install WordPress. For 99% of situations, **you should leave this field blank**. Leaving it empty means WordPress will be installed at your main domain. That is, if your domain is YOURDOMAIN.com, then WordPress will be installed at YOURDOMAIN.com rather than something like YOURDOMAIN.com/mywpsite.

In Directory The directory is relative to your domain and <b>should not exist</b> . e.g. To install at http://mydomain/dir/ just type <b>dir</b> . To install only in http://mydomain/ leave this empty.	Leave empty for most situations	
A bit further down, you need to enter your site's name and description. You interface:	r your <b>Site Settings</b> . These are just the defa	ult values for e WordPress
Site Name	Your Site's Name	
Site Description	A short description of your site	
Enable Multisite (WPMU) 🚯		

Do **not** enable WordPress Multisite unless you're specifically trying to create a multisite network.

You'll also need to create login credentials for your WordPress account. You'll use this username/password combination to log into your WordPress dashboard after installation, so make sure that you remember it:

## **Digital Marketing**

Depending on the specific autoinstaller that you're using, you might see a few other options as well. You can safely ignore these. That is, it's fine to leave anything I didn't cover as the defaults.

Once you've filled out everything, make sure to click **Install** at the bottom of the screen. It might take a minute or so to run. Then, you should get a confirmation. You can log into your brand new WordPress install by going to YOURDOMAIN.com/wp-admin.

And that's it! You just learned how to install WordPress manually. You can now log in with the account details that you entered during the install process:
